PCN Profile – Kettering and South West Rural

Introduction

The profile incorporates information from a variety of sources, including Public Health England General Practice Profiles, NHS Digital, and local Northamptonshire County Council held data for Adult and Children’s Social Care and Public Health. The profile aims to:

• Illustrate the demography of the area.
• Summarise key aspects of health and wellbeing for the PCN catchment, highlighting variations where possible.
• Benchmark PCNs against the Northamptonshire PCN average. With the future aim of benchmarking nationally once data has been collated on a national level for PCN geographies.

This is the health and wellbeing profile for Kettering and South West Rural PCN. This PCN includes the following practices:

• K83037 - Burton Latimer Medical Centre
• K83039 - Drylands Surgery
• K83625 - Mawsley Medical Centre

The map on the right shows the catchment boundary for the PCN and the percentage of the population of each area registered with one of the GPs above. The areas with the highest registered populations to this PCN include areas within Slade, Burton Latimer and Finedon wards.
PCN Profile – Kettering and South West Rural

Headlines and commentary

Population
• This PCN has a population of 30,242.
• Expected population growth by 2025 = 44.9%. This is higher than the Northamptonshire PCN average (11.9%).
• PCN population age profile is older than the Northamptonshire PCN average.

Summary of Health & Wellbeing (Life expectancy)
• Male and Female life expectancy – significantly higher than Northamptonshire PCN average.
• Premature cancer deaths – similar to Northamptonshire PCN average (after accounting for age differences).
• Premature deaths from cardiovascular disease, respiratory disease and flu – significantly lower than Northamptonshire PCN average (after accounting for age differences).

Social Determinants of Health
The Index of Multiple Deprivation is calculated across a number of domains that look at social determinants such as income, employment, education, crime, barriers to housing and living environment. Higher deprivation is correlated with lower life expectancy and poorer health outcomes. PCN variation is shown on Page 6 with pockets of high deprivation across the area of the PCN that covers Northampton district, such as areas in Avondale Grange, All Saints, Northfield and St Michael’s and Wicksteed wards.
• An estimated 65% of the population are in paid work or full time education and 2% unemployed - similar to Northamptonshire PCN average.
• Higher risk areas for social isolation within the PCN catchment are shown on page 9.

Risk factors
• 21% of children in this PCN aged 4 to 5 years are estimated to be overweight or obese – significantly higher than the Northamptonshire PCN average.
• This rises to 27% of children aged 10 to 11 who are overweight or obese – similar to Northamptonshire PCN average.
• 16% of the population are recorded as smoking – significantly lower than the Northamptonshire PCN average.
• 1 in 3 patients accessing smoking cessation services successfully quit at 4 weeks – similar to Northamptonshire PCN average.
• Blood pressure management for hypertensive patients is significantly above the average for all Northamptonshire PCNs and above the national expectation (80%).

Page 8 highlights the variation across the catchment for increased risk of obesity looking at physical activity levels, child and adult obesity, healthy diets and obesity related health conditions. The areas of higher risk identified include areas within Finedon, St Peter’s, Northfield, All Saints and Avondale Grange wards.
PCN Profile – Kettering and South West Rural

Headlines and commentary

Long Term Conditions (LTCs)

- Prevalence
  • Lower than average depression and dementia recorded prevalence, similar to average asthma prevalence, all other recorded prevalence (included in this profile) are significantly higher than the Northamptonshire PCN average.

Further work would be needed to ascertain whether higher recorded prevalence rates are expected based on local demographics and case mix.

- Hospital Admissions
  • Over half (60%) of hospital admissions, for patients registered to this PCN, are for patients with 1 or more long term conditions, just under half of these (49%) are for patients with multiple conditions (2 or more).
  • The rate of admissions for patients with multiple long term conditions (taking into account age differences) – significantly below the Northamptonshire PCN average.
  • Emergency admissions rate for circulatory and respiratory disease (taking into account age differences) – similar to the Northamptonshire PCN average.
  • Emergency admissions rates overall and for cancer (taking into account age differences) – significantly lower than Northamptonshire PCN average.

High levels of emergency admissions may be due to a variety of causes and therefore this information should be used as an indication of levels of unplanned secondary care use within a population with local interpretation and case mix needed for context.

Caring and Service Use

- 18% of PCN population are reported to have a caring responsibility – similar to the Northamptonshire PCN average.
- The percentage of children assessed by social care is significantly lower than average. The percentage of adults in this PCN accessing Adult Social Care is similar to the average for Northamptonshire PCNs. Local variation is shown on Page 7, highlighting higher access in areas within St Peter’s, Brambleside, Avondale Grange and Finedon wards.

Opportunities

Certain interventions can improve local health and wellbeing outcomes, such as increasing exercise or stopping smoking, through healthcare interventions such as early diagnosis, effective treatment, NHS Health Checks and tackling social determinants of health. Examples of opportunities for this PCN include:

- The coverage of MMR in 3 and 4 years olds is significantly higher than the Northamptonshire PCN average and in the top 20% of PCNs.
- Flu vaccination coverage is significantly above the average for Northamptonshire PCNs but below the national expectations. To reach the national expectation of 75% for flu vaccinations an additional 222 people aged 65 years and over would need to be vaccinated and an additional 105 vaccinated in at risk groups to reach the national expectation of 55%.
- The percentage of people offered a health check is similar to the Northamptonshire PCN average, those completing the health check is significantly below the average. To reach the Northamptonshire target the number of health checks offered and completed would need to increase by 771 and 754.

Key population figures

- Total PCN population May 2019: 30,242
- Projected PCN population Dec 2025: 43,831 (+44.9%)

Demographics – May 2019 population

- **Life expectancy at birth**
  - PCN population: 85.9
  - Northamptonshire PCNs average: 83.3
  - Compared to average: Higher

- **Life expectancy at 65**
  - PCN population: 23.0
  - Northamptonshire PCNs average: 21.2
  - Compared to average: Higher

- **Births (2017)**: 276
- **Deaths (2018)**: 203
PCN Profile – Kettering and South West Rural

Social care

% registered patients aged under 18 received children's social care single assessment (2018/19)

% registered patients aged 18+ accessing adult social care services (2018/19)

Local area residents receiving adult social care (MSOA rate per 1,000)
Kettering and South West Rural PCN

- PCN inner catchment area
- Proposed unitary boundary

MSOA residents receiving adult social care:
- 4.1 - 9.6 per 1,000 (lowest 20%)
- 9.6 - 12.2 per 1,000
- 12.2 - 14.7 per 1,000
- 14.7 - 19.0 per 1,000
- 19.0 - 47.0 per 1,000 (highest 20%)

Lifestyles and Long Term Conditions (LTCs)

Lifestyle has a profound impact on health and wellbeing. According to the Global Burden of Disease 2017, the top 10 risk factors (such as tobacco, dietary risks and alcohol use) can be attributed to nearly 90% of ill-health and death in Northamptonshire.

For Kettering and South West Rural PCN:
• Smoking prevalence is significantly lower than the Northamptonshire PCN average.
• Variations in prevalence of obesity and associated risk factors are shown in the map.
• Hospital admissions for patients with a long term condition are significantly higher than the Northamptonshire PCN average.

PCN Profile – Kettering and South West Rural

Social Isolation and mental wellbeing (life satisfaction) – local variation
## Health and Wellbeing Summary for Kettering and South West Rural PCN, June 2019

### Children
- Babies born (2017): 276
- Registered population aged under 16: 6,622
- Vaccinated for MMR (2 doses) at age 4: 91%
- Reception children overweight or obese: 21%
- Year 6 children overweight or obese: 27%
- Patients under 18 assessed by NCC Children’s Social Care: 2.2%

### Adults
- Registered working age population (16-64): 18,313
- Women (25-64) with cervical screening in last 5 years: 79%
- BP ≤ 150/90mmHg in hypertensive patients: 85%
- Hypertension: QOF prevalence: 15%
- Smoking cessation: 4 week quit rate: 33%
- GP patient survey smoking prevalence: 15%
- Estimated smoking prevalence (QOF): 16%
- Unemployed: 2.1%

### End of Life
- Average female life expectancy: 86
- Average male life expectancy: 83
- Under 75 deaths per 100,000: flu: 31
- Under 75 deaths per 100,000: respiratory: 73
- Under 75 deaths per 100,000: cancer: 131
- Under 75 deaths per 100,000: CVD: 82
- Deaths (2018): 203

### Mortality
- Under 75 deaths per 100,000: respiratory: 190
- Under 75 deaths per 100,000: cancer: 1,581
- Flu vaccination uptake: at risk: 52%
- Flu vaccination uptake: ages 65+: 71%

Notes - Methodology and Data Sources

Most data presented at PCN level has either been aggregated from GP level data in the PHE General Practice Profiles or calculated from raw data that includes the patient’s registered GP, such as the Public Health Deaths file and Hospital Episode Statistics or SUS.

In some cases data has been based on resident populations rather than GP registered population. In these cases the Public Health Intelligence team have modelled the resident data to apply it to the catchment population for each PCN. This method involves applying the number of patients for each applicable age cohort (e.g. 18 years and over) registered to each GP in a LSOA (a small geographical area with an average population of roughly 1,500) to the resident based data and thereby providing an estimate of the number of residents who, for example, accessed a service or have a particular health outcome for each GP. This applies to the child obesity data, adult and children’s social care data.

It is important to present rates which have taken into account age differences between populations for comparison purposes, particularly when looking at deaths and admissions to hospital which can have higher rates in the older populations. Directly Standardised Rates (DSR) have been used for this profile. A DSR is where age-specific rates of the subject population are applied to the age structure of the standard population (European Standard Population). This gives the overall rate that would have occurred in the subject population if it had the standard age-profile.

Mental wellbeing life satisfaction score is taken from the 2015 mental wellbeing survey – further details can be found here.

The social isolation index has been calculated based on a number of indicators (single person households, access to transport, income, age, mental wellbeing and social contacts).

Some of the data within the practice profiles refers to data from the GP patient survey. Where possible the patient survey data has been presented alongside recorded data to give an estimate of the local picture. In some cases there may be a large disparity between the two and this will likely reflect the sampling of the patient survey and who responded or the recording of local data so needs to be interpreted within this context.

Where data is presented as Blue, Orange, Blue in the infographic this denotes the significant difference and suggests further local consideration is needed for interpretation. It does not imply that being different is negative.
