PCN Profile – MMWF

Introduction

The profile incorporates information from a variety of sources, including Public Health England General Practice Profiles, NHS Digital, and local Northamptonshire County Council held data for Adult and Children’s Social Care and Public Health. The profile aims to:

• Illustrate the demography of the area.
• Summarise key aspects of health and wellbeing for the PCN catchment, highlighting variations where possible.
• Benchmark PCNs against the Northamptonshire PCN average. With the future aim of benchmarking nationally once data has been collated on a national level for PCN geographies.

This is the health and wellbeing profile for MMWF PCN. This PCN includes the following practices:

• K83025 - The Mounts Medical Centre
• K83033 - Weston Favell (Dr Molla)
• K83076 - Weston Favell (Dr Dias)
• K83618 - Favell Plus
• K83621 - Maple Access Partnership

This PCN profile includes a practice (maple access partnership) which specialises in services for vulnerable population groups such as the homeless, substance misusers and those with mental health conditions. Therefore some of the aggregated results in this profile will need interpreting with this in mind.

The map on the right shows the catchment boundary for the PCN and the percentage of the population of each area registered with one of the GPs above. The areas with the highest registered populations to this PCN include areas within Castle, St James, Riverside and Brookside wards.
PCN Profile – MMWF

Headlines and commentary

Population
• This PCN has a population of 47,571.
• Expected population growth by 2025 = 30.3%. This is higher than the Northamptonshire PCN average (11.9%).
• PCN population is younger than Northamptonshire PCN average, particularly the 20-44 year old age group.

Summary of Health & Wellbeing (Life expectancy)
• Male and Female life expectancy – significantly lower than Northamptonshire PCN average.
• Premature deaths attributable to flu – similar to Northamptonshire PCN average (after accounting for age differences).
• Premature cancer, cardiovascular and respiratory disease deaths – significantly higher than Northamptonshire PCN average (after accounting for age differences).

Social Determinants of Health
The Index of Multiple Deprivation is calculated across a number of domains that look at social determinants such as income, employment, education, crime, barriers to housing and living environment. Higher deprivation is correlated with lower life expectancy and poorer health outcomes. PCN variation is shown on Page 6 with pockets of high deprivation in the northern part of the PCN catchment such as areas within Billing, Rectory Farm, Talavera, Eastfield, Kings Heath, Semilong, St James, Briars Hill, Spencer, St David’s, Castle and Abington wards.

• An estimated 71% of the population are in paid work or full time education and 7% are unemployed, both significantly higher than the Northamptonshire PCN average.
• Higher risk areas for social isolation within the PCN catchment are shown on page 9.

Risk factors
• 17% of children in this PCN aged 4 to 5 years are estimated to be overweight or obese – similar to the Northamptonshire PCN average.
• This rises to 30% of children aged 10 to 11 who are overweight or obese – significantly higher than the Northamptonshire PCN average.
• 28% of the population are recorded as smoking – significantly higher than the Northamptonshire PCN average.
• 29% of patients accessing smoking cessation services successfully quit at 4 weeks - significantly below Northamptonshire PCN average.
• Blood pressure management for hypertensive patients is significantly below the average for all Northamptonshire PCNs and below the national expectation (80%).

Page 8 highlights the variation across the catchment for increased risk of obesity looking at physical activity levels, child and adult obesity, healthy diets and obesity related health conditions. The areas of higher risk identified include areas within Delapre and Briars Hill, Castle, Spencer, Kings Heath, Spring Park, Talavera, Rectory Farm, Billing, Riverside and Abington.
PCN Profile – MMWF
Headlines and commentary

Long Term Conditions (LTCs)

- Prevalence
  - Lower than average recorded prevalence (included in this profile) compared to Northamptonshire PCN average. This is likely to reflect the younger age profile of the PCN but further work would be needed to ascertain whether higher recorded prevalence rates are expected based on local demographics and case mix.

- Hospital Admissions
  - Just over 1 in 4 (29%) of hospital admissions, for patients registered to this PCN, are for patients with 1 or more long term conditions, just over half of these (54%) are for patients with multiple conditions (2 or more).
  - The rate of admissions for patients with multiple long term conditions (taking into account age differences) – significantly lower than the Northamptonshire PCN average.
  - Emergency admissions rate (taking into account age differences) – significantly higher than the Northamptonshire PCN average.

Hospital Admissions information should be used as an indication of levels of unplanned secondary care use within a population with local interpretation and case mix needed for context.

Caring and Service Use

- 12% of PCN population are reported to have a caring responsibility – significantly below the Northamptonshire PCN average
- The percentage of children assessed by social care is significantly higher than the Northamptonshire PCN average. The percentage of adults in this PCN accessing Adult Social Care is significantly below the average. Local variation is shown on Page 7, highlighting higher access in areas within Kings Heath, New and Old Duston, Spring Park, Trinity and Westone wards.

Opportunities

Certain interventions can improve local health and wellbeing outcomes, such as increasing exercise or stopping smoking, through healthcare interventions such as early diagnosis, effective treatment, NHS Health Checks and tackling social determinants of health. Examples of opportunities for this PCN include:

- To reach national expectation of 80% an additional 108 hypertensive patients would need to have their blood pressure recorded within recommended levels.
- MMR vaccination coverage for 3 and 4 year olds is significantly below the average for all Northamptonshire PCNs. To reach the average an additional 133 children would need to receive their MMR vaccination.
- Flu vaccination coverage is significantly below the Northamptonshire PCN average. To reach the national expectation of 75% for flu vaccinations an additional 592 people aged 65 years and over would need to be vaccinated and an additional 696 vaccinated in at risk groups to reach the national expectation of 55%.
- The proportion of eligible patients offered a health check is above average but the proportion completing the health check is significantly below average. To reach the Northamptonshire target the number of health checks offered and completed would need to increase by 590 and 828.
- To reach the top 20% smoking quit rate, an additional 33 quits would be needed in the year.

Lifestyles and Long Term Conditions (LTCs)

Lifestyle has a profound impact on health and wellbeing. According to the Global Burden of Disease 2017, the top 10 risk factors (such as tobacco, dietary risks and alcohol use) can be attributed to nearly 90% of ill-health and death in Northamptonshire.

For MMWF PCN:
• Smoking prevalence is significantly higher than the Northamptonshire PCN average.
• Variations in prevalence of obesity and associated risk factors are shown in the map.
• Hospital admissions for patients with long term conditions are significantly lower than the Northamptonshire PCN average.

PCN Profile – MMWF

Social Isolation and mental wellbeing (life satisfaction) – local variation
Health and Wellbeing Summary for MMWF PCN, June 2019

**CHILDREN**
- Babies born (2017): 648
- Registered population aged under 16: 10,818
- Vaccinated for MMR (2 doses) at age 4: 67%
- Reception children overweight or obese: 17%
- Year 6 children overweight or obese: 30%
- Patients under 18 assessed by NCC Children’s Social Care: 3.9%

**ADULTS**
- Registered working age population (16-64): 33,227
- Women (25-64) with cervical screening in last 5 years: 66%
- BP ≤ 150/90mmHg in hypertensive patients: 78%
- Hypertension: QOF prevalence: 11%
- Smoking cessation: 4 week quit rate: 29%
- GP patient survey smoking prevalence: 24%
- Estimated smoking prevalence (QOF): 28%
- Unemployed in paid work or full-time education: 7%

**END OF LIFE**
- Average female life expectancy: 81
- Average male life expectancy: 78
- Under 75 deaths per 100,000: flu: 53
- Under 75 deaths per 100,000: respiratory: 116
- Under 75 deaths per 100,000: cancer: 169
- Under 75 deaths per 100,000: CVD: 179
- Deaths (2018): 240

**MORTALITY**
- Under 75 deaths per 100,000: Stroke: 1,254
- Under 75 deaths per 100,000: Asthma: 293
- Under 75 deaths per 100,000: Heart failure: 1,922

Notes - Methodology and Data Sources

Most data presented at PCN level has either been aggregated from GP level data in the PHE General Practice Profiles or calculated from raw data that includes the patient’s registered GP, such as the Public Health Deaths file and Hospital Episode Statistics or SUS.

In some cases data has been based on resident populations rather than GP registered population. In these cases the Public Health Intelligence team have modelled the resident data to apply it to the catchment population for each PCN. This method involves applying the number of patients for each applicable age cohort (e.g. 18 years and over) registered to each GP in a LSOA (a small geographical area with an average population of roughly 1,500) to the resident based data and thereby providing an estimate of the number of residents who, for example, accessed a service or have a particular health outcome for each GP. This applies to the child obesity data, adult and children’s social care data.

It is important to present rates which have taken into account age differences between populations for comparison purposes, particularly when looking at deaths and admissions to hospital which can have higher rates in the older populations. Directly Standardised Rates (DSR) have been used for this profile. A DSR is where age-specific rates of the subject population are applied to the age structure of the standard population (European Standard Population). This gives the overall rate that would have occurred in the subject population if it had the standard age-profile.

Mental wellbeing life satisfaction score is taken from the 2015 mental wellbeing survey – further details can be found here.

The social isolation index has been calculated based on a number of indicators (single person households, access to transport, income, age, mental wellbeing and social contacts).

Some of the data within the practice profiles refers to data from the GP patient survey. Where possible the patient survey data has been presented alongside recorded data to give an estimate of the local picture. In some cases there may be a large disparity between the two and this will likely reflect the sampling of the patient survey and who responded or the recording of local data so needs to be interpreted within this context.

Where data is presented as Blue, Orange, Blue in the infographic this denotes the significant difference and suggests further local consideration is needed for interpretation. It does not imply that being different is negative.
